

## Get more approvals in less time

**NetProfiler®** enabled means you have the potential to make all your spectrophotometers measure consistently anytime... anywhere – all from a single remote location. And NetProfiler is brand independent, which means you can reduce instrument variance on the most popular spectrophotometer brands!

### Compatibility with the most important asset... your color data

Color iQC is compatible with most popular color quality control data formats, so you can easily upgrade without risk to your data.

#### Color iQC lets you:

- Easily manage multiple jobs.
- Optimize process and machine time.
- Respond faster with more accurate color.

#### How does your process affect color?

Time, temperature, moisture and other inherent plant or machine conditions can affect color consistency. Color iQC includes the features you need to identify and track these process variables while minimizing their effects on color including:

- Tags to help diagnose equipment- or other process-related color shifts.
- Logical Tolerancing to compensate for process variables while keeping color within the range your customer will accept.

# adapts to your workflow

## Work more effectively within your lab

Color iQC simplifies color quality control so you can focus on the job and not the software.

Job-driven workflows adapt to your processes by providing the information you need in the format you prefer. Plus, you can print exactly what you see.

**Real World Example:** Molded parts for the XYZ Company call for a similar color and tolerance as a previous job, but the cycle time and temperature differ. Job templates let you quickly recall the previous job and easily adapt it to your new job parameters.

Network accessible data storage means that more operators can access the data locally or globally without compromising data integrity. And you don't need a production system to see production results. Lab managers and shift supervisors can gain remote access to view, report or act on any job without interfering with the production system.

**Real World Example:** Your job shop is at full capacity, but a sister location has the capacity to manufacture the parts. You can easily route the job to another Color iQC operator complete with all job parameters.

Job templates make startup faster and are easily customized to each operator's preference. You only have to set up a job once and the software remembers everything... right down to your preferred screen layout.

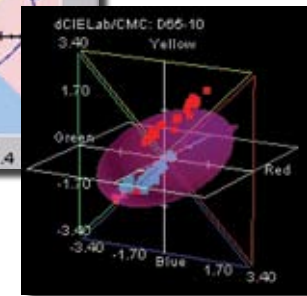

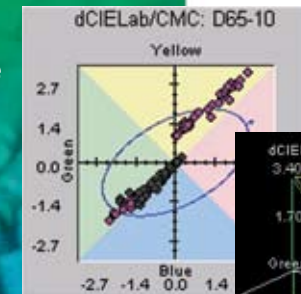

## Work more effectively with worldwide facilities, supply chain and customers

e-Submit uses the speed and reach of the Internet to streamline collaborative product development with world-wide facilities, supply chain and customers.

**Real World Example:** Have customers approve a digital submission before expending time and materials on physical samples. eSubmits save person hours and valuable machine time because you only make samples from previously approved submissions.

## New Manager Versions

You don't have to invest in a complete system just to view data. Any Color iQC or Match system is available in a convenient manager version, so you can see what's happening in the lab or production without leaving your office.

## Logical Tolerancing

increases approval rates. It lets you predict what your customer will approve. Plus, the 3D plot helps you better manage acceptable variations within a batch.

Before texturing

After texturing

### Will your customer accept this?

On-screen color helps you decide. It simulates how your product will look with texture added.

## Electronic sample submits at a fraction of the cost!

Electronic color communication just got easier for a whole lot less... on-screen color - now with texturing. You can accurately simulate color and texture electronically.

But here's the best news... you can share these real-life simulations at a fraction of what other stand-alone simulators cost.

Plus, it's built into the Color iQC software. So, unlike other simulators, it doesn't require a separate program.

## New Manager Versions

You don't have to invest in a complete system just to view data. Any Color iQC or iMatch system is available in a convenient manager version, so you can see what's happening in the lab or production without leaving your office.

## New Knowledge Base

Speeds color matching and boosts productivity.

Build your matching expertise into every job.

Transfer knowledge gained from one job to the next so all operators benefit.

## New Online Color Matching

### And here's the best part...

you'll save hours in admin time.

No clients, applets or software discs.

You simply assign passwords

– everything runs directly from your server. It's remote control color control!

## Cut System Administration in Half

Now you can match color over your WAN or LAN. Centralize control of your data but allow shared access with other facilities, suppliers... even customers.

Plus, it's fast and secure!

And with the new Knowledge Base, you can also share your color matching expertise by building it right into every job.

### All you need is one system. You control the rest!

- Add as many users as you need – without compromising speed.
- Assign access privileges based on your parameters such as experience level, job function and more.
- Provide real-time system updates to your entire network in just minutes!
- Centralize your data and eliminate cumbersome, inaccurate data silos.
